This guidebook, now thoroughly updated and revised in its second edition, gives comprehensive advice on the designing and setting up of monitoring programmes for the purpose of providing valid data for water quality assessments in all types of freshwater bodies. It is clearly and concisely written in order to provide the essential information for all agencies and individuals responsible for the water quality.

'The book is well illustrated with a wealth of clear diagrams, tables, graphs, and photographs. Readers who should

benefit include researchers, technicians, and engineers in water-related disciplines ... together with anyone with an interest in water quality. It ... should appeal to a wide audience, avoiding as it does complex mathematical and biological formulae and theories' - IWEM Journal
